

DEVICE CAPABLE OF SETTING OPERATING CONDITIONS, METHOD OF
SETTING OPERATING CONDITIONS AND TEST METHOD

5

ABSTRACT OF THE DISCLOSURE

10 A device control module reads in conditions of switches, such as front panel
switches, when an operator selects a test mode. The device control module stores
a predetermined conditions of the switches, and when the read-in conditions of
the switches satisfy a predetermined conditions, the device control module
notifies a result to the operator. The result can be notified to the operator by
turning on and off a display, such as an LED. When the test result satisfies a
predetermined condition, the display could be turned off. While the test result
does not satisfy a predetermined condition, the display could be turned on.
